

274Lab — Features That Make Us Unbeatable

A competitive moat strategy for JAMB 2026 and beyond

The core thesis

Competitors can copy quiz features overnight (timed tests, leaderboards, scoring, 26-week curriculum). They cannot copy the *time a student has already invested* in 274Lab. Every feature below is designed to increase that investment and make switching feel like starting from zero.

1 The Performance Timeline

The student's full JAMB journey visualised: every quiz, every score, every sub-topic diagnosis, every medal, every week — going back months. A scrollable, beautiful line chart of their 4 subjects across 26 weeks.

HIGHEST MOAT

Why it locks students in: A student who has 6 months of data here cannot leave. Any competitor starts them from zero. That chart is the single biggest reason they won't delete the app — it feels like throwing away their medical records. It is also the most viral screenshot: students post "look at my improvement over 18 weeks."

Same for teachers: a guardian dashboard with trends across 50+ students. Once a school adopts 274Lab, they will never switch to a platform that resets everyone to zero.

2 Streaks & the "274 Badge"

A visible counter on the dashboard: "You've studied 23 out of 274 days before UTME. Keep the streak alive." The counter increments only if the student opens the app and does *something* meaningful (quiz, review, or even just viewing their autopsy) each day.

VERY HIGH MOAT

Why it locks students in: Streak mechanics are the strongest retention loop in EdTech across every app category (Duolingo, Snapchat, GitHub). A student on day 134 of 274 will not abandon the app. Competitors can copy a quiz feature overnight — they cannot copy 134 days of accumulated investment.

Revenue angle: A "Lost Streak Recovery" — pay ₦200 to buy back a missed day. This funds the feature and is also a psychological anchor (₦200 feels cheap compared to losing a 100-day streak).

3 The "Second Brain" — Spaced Repetition of Mistakes

Every question the student gets wrong is saved to a "My Dumb Questions" deck. Every evening at 8pm, a push notification delivers one card from that deck: "Remember this one? You got it wrong on Week 7. Tap to answer it now." If they get it right 3 times, it graduates out of the deck.

VERY HIGH MOAT

Why it locks students in: This is the single most effective learning mechanism in the world — spaced repetition of your own mistakes. No other JAMB app does this. Once a student has 200+ cards in their

deck, switching to another app means losing their personalised mistake bank. That deck is irreplaceable.

No competitor can replicate it for a migrating user because they don't have the history of which questions that student got wrong.

4 Class Mode (Peer + Network Effects)

A student creates or joins a class ("Adeola Memorial College SS3A"). Inside the class: a mini-leaderboard (only visible to classmates), a class-average line on each student's performance chart, a "who's studying now" live indicator, and a class streak count that increments if everyone in the class opens the app today.

HIGHEST NETWORK MOAT **Why it locks students + schools in:** If a whole class is on 274Lab, no individual can leave — everyone else in the class is their accountability. Competitors cannot replicate the class because they don't have the class. This is also your free distribution channel: one student invites their entire class to join.

School-level lock-in: Once a school's teachers, parents, and students all have accounts and class data, the switching cost is enormous. The school would need to re-onboard everyone on a new platform.

5 The Weekly Showdown (Head-to-Head)

Every Friday, before the quiz window opens, the app pairs each student with someone who has a similar average score. Both see: "Your opponent this week: Chioma (avg 63%, same as you). Beat her and earn a bronze medal, even if your total is low."

HIGH MOAT **Why it locks students in:** It transforms the quiz from "test your knowledge" into "I must not lose to Chioma." Emotional investment creates app opens on random days just to check if Chioma has pulled ahead.

Social flywheel: Students will talk about it in school ("Chioma beat me by 3 points on Friday"). That word-of-mouth is free acquisition.

6 The UTME Confidence Score

A single proprietary number on the dashboard: "Your UTME confidence score is 67%." It factors in: current average (weighted by recency), number of weeks completed vs total, weak sub-topics closed vs remaining, and streak length.

MEDIUM BUILD — HIGH IMPACT **Why it locks students in:** It is 274Lab's own number. No other app has it. A student who has been building their confidence score for 4 months is emotionally invested in seeing it reach 95% before exam day. It gamifies the entire prep, not just individual quizzes, and it is highly shareable as a screenshot.

Build Priority

Feature	Build time	Moat strength	Why build next
1. Performance Timeline	2-3 days	Highest retention	Gives every student a reason to stay & a screenshot to share

2. Streaks + 274 Badge	1-2 days	Very high retention	Daily habit loop; revenue from streak buyback
3. Second Brain (Spaced Rep)	2-3 days	Very high retention	Irreplaceable mistake deck; proven learning impact
4. Class Mode	3-5 days	Highest network moat	School-level lock-in; free distribution
5. Weekly Showdown	2-3 days	High engagement	Social word-of-mouth engine
6. UTME Confidence Score	1 day	Medium — high if shared	Quick win; proprietary metric

Recommended first 3 to ship

Timeline → Streaks → Second Brain. These three together make the app feel like a personal training journal that the student has invested months into. That investment is the moat. Everything else (Class Mode, Showdown, Confidence Score) amplifies it further but these three are the foundation.
